

Enigma Focus

Complete User Manual & Technical Reference Guide

Mindful App Blocking, Hardware Grayscale, and Digital Detox Platform

1. Introduction

Enigma Focus is a production-grade digital wellbeing and productivity app for Android engineered around the Unix philosophy: *do one thing and do it exceptionally well*. It empowers you to reclaim your time and focus by eliminating compulsive dopaminergic phone habits through hardware-level GPU monochrome mode, mindful breathing friction, and aggressive sleep schedule lockouts.

Key Feature Highlights

- **Sub-20ms Accessibility Interception:** Real-time app and website blocking with zero battery drain.
- **10-Second Mindful Breathing Challenge:** Inhale, Hold, and Exhale guide before unlocking.
- **Hardware GPU Monochrome:** Direct Daltonizer display compositor control (WRITE_SECURE_SETTINGS).
- **Aggressive Bedtime Lockout (10:30 PM – 6:30 AM):** Strict 1-minute emergency cap during sleep hours.
- **Unix Philosophy & CLI Automation:** 14 Broadcast Intents for ADB, Termux, and Tasker integration.

2. Initial Setup & Required Permissions

To deliver unbreakable focus protection, Enigma Focus utilizes two core Android system permissions:

2.1. 1. Accessibility Service

Allows the engine to instantly detect when a restricted app or distracting web domain is opened:

1. Go to **Settings** → **Accessibility** → **Downloaded Apps** / **Installed Services**.
2. Tap **Enigma Focus** and enable the toggle.

2.2. 2. Hardware Grayscale Permission (WRITE_SECURE_SETTINGS)

Enables the app to command the GPU display compositor to enter monochrome mode. Connect your phone to a computer with USB Debugging enabled and run:

```
adb shell pm grant com.example.enigmafocus android.permission.WRITE_SECURE_SETTINGS
```

3. Core Features & Daily Operations

3.1. Manual Focus Timer Sessions

On the main **Focus** tab:

- Select your desired focus session chip: **25 min** (Pomodoro), **1 hour**, **4 hours**, or **9h Workday**.

- Tap **Start Session**. Hardware grayscale turns on (if enabled), an ongoing status bar countdown appears, and all target apps are blocked.
- To conclude early, tap **Stop Session**.

3.2. Scheduled Recurring Focus Intervals

Enigma Focus includes two preconfigured default intervals:

1. **Workday Shift**: 07:30 - 16:30 (Monday to Friday).
2. **Rest / Sleep**: 22:30 - 06:30 (Every day).

Tap the **Edit** button on any interval to adjust start/end times and active days, or tap + **Add Schedule / Interval** to create custom routines (e.g. Evening Study from 18:00 to 20:30).

3.3. Mindful Breathing Challenge

When you launch a blocked app (e.g. Instagram, TikTok, or Reddit), an immersive dark screen immediately covers the display:

1. **Inhale** deeply through your nose (Seconds 10 to 8).
2. **Hold** your breath calmly (Seconds 7 to 5).
3. **Exhale** slowly and release tension (Seconds 4 to 1).
4. Once completed, choose "**Return to Focus**" to go Home or "**Use app for 1 minute**" for emergency access.

3.4. Aggressive Bedtime Lockout

During your sleep window (22:30 - 06:30):

- Every screen turn-on or phone unlock is immediately intercepted by the bedtime lock overlay.
- Emergency access is capped at **strictly 60 seconds** after passing the 10s breathing challenge.
- When 60s expire or the screen is turned off, the background watchdog immediately re-locks the device.
- Emergency phone calls (**InCallUI**) and alarm clocks (**DeskClock**) remain permanently accessible.

4. Managing Blocked Applications

On the **Apps** tab:

- Use the real-time search bar to find any application installed on your device.
- Toggle individual switches to add or remove apps from your blocklist.
- Tap **Block Popular** to instantly restrict major social media and distraction platforms in 1 tap.

5. Unix CLI Broadcasts & Script Automation

Control Enigma Focus directly from terminal, Termux, or Tasker via standard Android broadcast intents:

```
# Start a 45-minute focus session
adb shell am broadcast -a com.example.enigmafocus.action.START_SESSION --ei
    duration_minutes 45

# Stop active session
adb shell am broadcast -a com.example.enigmafocus.action.STOP_SESSION

# Toggle hardware grayscale
adb shell am broadcast -a com.example.enigmafocus.action.TOGGLE_GRAYSCALE

# Query status JSON
adb shell am broadcast -a com.example.enigmafocus.action.GET_STATUS

# Apply template (DEFAULT, WORKDAY_ONLY, BEDTIME_STRICT, DIGITAL_DETOX)
adb shell am broadcast -a com.example.enigmafocus.action.APPLY_TEMPLATE --es
    template BEDTIME_STRICT
```

6. Xiaomi / MIUI / HyperOS Optimization Guide

To prevent aggressive OEM battery managers from stopping background protection:

1. **Autostart:** Settings → Apps → Enigma Focus → Autostart → Allow.
2. **Battery Saver:** Select No restrictions.
3. **Display Pop-up Windows:** Set to Always Allow.
